Interior and exterior angle formulas: The sum of the measures of the interior angles of a polygon with n sides is $(n - 2)180$. The measure of each interior angle of an equiangular n -gon is If you count one exterior angle at each vertex, the sum of the measures of the exterior angles of a polygon is always 360° .

To explore the truth of this rule, try Math Warehouse's interactive triangle, which allows you to drag around the different sides of a triangle and explore the relationship between the angles and sides.No matter how you position the three sides of the triangle, the total degrees of all interior angles (the three angles inside the triangle) is always 180° .

You can see that the interior angle and exterior angle are supplementary, adding to 180° . As you drag the vertex downwards the polygon becomes concave, with the vertex pushed inwards towards the center of the polygon. As this happens the extended side now moves inside the polygon and the exterior angle becomes negative.

To begin this section, I'll give each student a copy of Prove Angle Relations in Circles. I start by having students read the prompt for item 1, which says "Prove that the measure of each angle formed by two chords that intersect inside a circle is equal to half the sum of the measures of the arcs intercepted by the angle and its vertical counterpart."
